Executive Summary

The primary objective of this audit is to provide a comprehensive confirmation that Bybit (hereinafter - Auditee, Bybit), a leading digital asset exchange, diligently safeguards user liabilities for in-scope digital assets. Through rigorous Proof of Reserve audit procedures, including Proof of Liabilities, Proof of Ownership, Reserves calculation, and Proof of Reserves Assessment, Auditee has demonstrated its commitment to transparency and user trust.

During the meticulous Proof of Reserves process, Bybit has successfully proved that its holdings provide full coverage for user liabilities, maintaining a remarkable 1:1 ratio for all in-scope assets. This assurance is substantiated by the compelling findings outlined.

Building Trust Through Proof of Reserves

About Hacken's Proof of Reserves

By implementing the Hacken's Proof of Reserves service, organizations can provide verifiable evidence of their reserve holdings, reassuring customers and stakeholders that their assets are securely held and fully backed. This transparency is essential in establishing trust and differentiating organizations within the crypto industry.

At Hacken, we are focused on verifying an organization's liabilities, such as customer deposits or outstanding loans, to ensure that the liabilities are accurately represented and can be met by the organization's assets.

The purpose of conducting Proof of Reserves audit is to provide transparency and assurance to stakeholders that the organization is operating in a trustworthy and responsible manner. The main objectives of a Proof of Reserves audit include confirming the existence and authenticity of cryptocurrency holdings, verifying the amount of cryptocurrency held matches the amount claimed by the organization.

Proof of Liabilities

Proof of Liabilities involves calculating all liabilities, which are the balances of in-scope assets held by the Auditee users, to form a Client Liability Report. As auditors, we collect the minimum necessary data from client's users to ensure their privacy is safeguarded. This may include a pair of public addresses/balances or UUID/public address/balance, depending on the specific requirements.

Proof of Ownership and Reserve Calculation

Hacken, a trusted third-party Proof of Reserves Assessor, ensures the accuracy of the Total Reserves Balance by verifying ownership of auditee's wallets. This crucial verification process precedes the comparison of the Total Reserves Balance with the Client Liability Report.

To achieve this, Hacken employs secure and verifiable methods like Custom Digital Signatures and "Send-to-Self" Transactions, among other methods, to confirm the ownership of addresses associated with the client's wallets.

- **Custom Digital Signatures** involve exchanging a Hacken-provided custom message, verifying corresponding digital signatures to establish ownership.
- **"Send-to-Self" Transactions:** Hacken provides the auditee with cryptocurrency to send to their own wallet. By inspecting transaction details and matching specific parameters, ownership of the address is confirmed. This meticulous approach ensures the accuracy of the Total Reserves Balance, enabling a comprehensive comparison with the Client Liability Report.

Proof of Reserves audit procedure

1. Preliminary Meetings and Information Flow Understanding

The audit started with a series of meetings aimed at understanding the information flow and the client's asset management methods. These discussions were critical in gaining a comprehensive view of the client's operational structure and the handling of cryptocurrency assets.

2. Supervision and Analysis of Client's Procedures

The client's existing scripts used for compiling their balance sheets were closely supervised. Essential credentials were obtained to facilitate an in-depth analysis. This step was crucial to understand the client's methods for asset compilation and balance reporting.

3. Development of Independent Algorithms for Balance Evaluation

To ensure an independent and unbiased assessment, new scripts were developed by Hacken.

These scripts focused on evaluating the client's available balance and staking, encompassing a range of assets such as cold wallets and hot wallets.

The objective was to cross-verify the client's reported data with an independently sourced dataset.

4. Selection of Clientele for Testing

The client was requested to provide a list of customers to be included in the audit test. For confidentiality purposes, each user associated with our client was assigned a unique user hash. This measure ensured that Hacken could not link any specific balances to identifiable individuals.

5. Procedure for User Data Collection

The client snapshots a list of their users in a specified format. The integrity of the source code was thoroughly verified. Under supervision, the client executed this algorithm to provide the necessary data.

6. Simultaneous Data Retrieval and Comparison

While the client executed the script, Hacken's auditors concurrently ran the independently developed program to ascertain the company's cryptocurrency balances. This step involved a meticulous one-to-one comparison of the assets.

7. Conclusion and Reporting

Upon completing the comparison, conclusions were drawn regarding the accuracy and integrity of the client's reported cryptocurrency reserves. The results of this comprehensive audit provided a clear picture of the client's reserve status, contributing significantly to transparency and trust in their financial reporting.

Proof of Reserves Audit Finding

Proof of Liabilities	Hacken's team obtained the total assets of Bybit liabilities report which was calculated using all clients' balances greater than 0.00000000 of in-scope assets with nominal balances. Additionally, Hacken conducted an extensive audit of the code used to generate the Merkle tree and verify its integrity. The team then proceeded to compare the output of the Merkle tree against the liabilities report. The Merkle proof generation and validation process was thoroughly examined using the official Merkle proof validation tool. This rigorous verification process, involving a comprehensive code audit, reconciliation of user balances, root hash calculations, and Merkle tree validations, has yielded compelling evidence supporting the integrity of the reported balances. While absolute certainty can rarely be attained, Hacken's findings strongly indicate the liabilities report accurately represents the underlying client balances.
Proof of Ownership and Reserves Calculation	Hacken's team obtained from Bybit management a complete list of all public keys/addresses holding in-scope assets. For each address, Bybit initiated a small outgoing transaction sending a minimum amount defined by Hacken from each address. Hacken monitored the respective blockchain and verified that the expected outgoing transactions with the defined amounts were received from each of the provided addresses. The fact that Bybit could initiate outgoing transactions from those addresses conclusively proved their control and ownership over those addresses at the time of this audit.

Team Composition

#	Team Member and Role	Components to review
1	Lead PoR Auditor (Joaquin Girardi) j.girardi@hacken.io	Audit Supervision, Interview conducting, Results and Recommendations
2	PoR Auditor (Alejo Cano) a.cano@hacken.io	Development and maintenance of Hacken's Proof of Reserves and verification tools

Conclusion

Bybit is dedicated to upholding the highest standards of financial security and ensuring the safety of its users' assets. By conducting regular Proof of Reserves audits, Bybit reaffirms its commitment to providing a trustworthy and reliable trading platform. Bybit's efforts towards transparency extend beyond merely creating a system for Proof of Reserves; the company has also committed to engaging an independent provider, Hacken, for verification of these reserves.

The latest verification, conducted by Hacken on **Friday, May 23, 2025**, included a comprehensive review of loan liability accountability and completeness, confirming an in-scope **reserve ratio exceeding 100%** even after considering these obligations. Bybit's diversified asset holdings and robust financial position allowed the platform to maintain full solvency, demonstrating the exchange's resilience and dedication to user fund security.

This report serves as a testament to the responsible financial management practices employed by Bybit, as well as the company's dedication to transparency and accountability.

Hacken Disclaimer

The information given for the assessment has been analyzed based on best industry practices at the time of the writing of this report, with issues or inconsistencies, the details of which are disclosed in this report.

The report contains no statements or warranties on identifying any technical security-related finding.

The report covers the information submitted and reviewed, so it may not be relevant after any modifications.

While this report provides a point-in-time attestation of on-chain assets based on the provided and verified blockchain addresses and data, it should not be considered a comprehensive financial audit of all assets, liabilities, or the organization's overall financial position.

While this report includes a thorough analysis of the provided blockchain addresses and data, point-in-time verification alone should not serve as the sole basis for assessment — conducting multiple independent proof of reserves attestations on a recurring basis is recommended to maintain transparency of on-chain assets over time.

English is the report's original language. The Consultant is not responsible for the accuracy of the translated versions.
